

RATHBONES

RATHBONE GREENBANK GLOBAL SUSTAINABLE BOND FUND

QUARTERLY UPDATE SEPTEMBER 2024

After a long, long wait, monetary policy easing has finally begun in earnest in the US and UK. Government bond yields tend to fall alongside interest rates when central banks ease monetary policy, leading to higher prices. This time around, government bond yields fell only briefly on relief that rates are heading lower as investors began to re-evaluate whether the BoE and Fed will keep cutting at the pace they'd hoped.

Ever since UK inflation fell to the Bank of England (BoE)'s target of 2% in June, investors have been impatient for the central bank to get cracking with its first rate cut in this cycle. At the start of August, the BoE cut rates by 0.25%, while signalling it intended to proceed cautiously. It kept rates on hold in September even as the US Federal Reserve (Fed) finally joined the rate-cutting club and opted for a double-strength 0.5% cut.

Fed chair Jerome Powell called its move a "good strong start" in policy easing, arguing that it was needed as US inflation continues to fall and concerns about the health of the US jobs market have grown. He described the unusually big cut as a "recalibration" of Fed monetary policy, seeming to suggest it wouldn't serve as a guide for the size of future cuts to come.

Big rate cutting tends to take place when central banks fear a recession is on the way. But, by and large, economic data in both the UK and the US is proving surprisingly good. The UK economy is growing more slowly than in the first half of the year, but it's still humming along quite nicely. And American GDP is growing by about 3% a year. That's higher than the trend of many years (barring the year of post-pandemic reopening). Yes, a rash of poor jobs data in early August fuelled a pessimistic turn in investors' views on the US economy. But there's since been a punchy rebound in some of the figures, painting a very different picture.

That raises questions about how much and how quickly the BoE and Fed will cut without a so-called economic hard landing. And that's driven investors to row back their expectations on the size and pace of rate cuts, pushing UK government bond (gilt) and US Treasury yields higher and their prices lower. (In continental Europe, by contrast, a tougher economic backdrop suggests that the European Central Bank is stepping up the rate-cutting it began back in June.)

The rates rally unravels

Because gilts and US Treasuries rallied a lot in August, we thought there was a good chance that their yields might subsequently unravel a bit. In the event, the yield on 10-year US Treasuries fell from 4.39% at the start of the quarter to as low as 3.66% in the first half of September, before then rising back up again. By mid-October, the 10-year Treasury yield had climbed above 4.0% for the first time since August. Gilt yields tracked a similar path. The 10-year gilt yield fell from 4.18% at the start of the quarter to as low as 3.76% in mid-September. But it had risen to 4.01% by quarter-end and to above 4.20% by early October.

BOND YIELDS RISE AS DATA SURPRISES

Source: FactSet, Rathbones

Some of that rise in gilt yields may have been exacerbated by investor jitters about how much the Labour government is planning to borrow when it unveils its first budget on 30 October. Investors can get spooked if they think governments intend to borrow above their means and will have to issue lots of new debt to pay for their spending plans. Remember former Prime Minister Liz Truss's mini-budget back in 2022? That sparked panic in gilt markets when the government announced tax cuts without explaining where it would get the money to pay for them. Investors feared much more gilt issuance than they'd expected, causing the UK's borrowing costs to skyrocket.

Chancellor Rachel Reeves is adamant that the Labour government won't repeat those "disastrous mistakes". Nevertheless, memories of the mini-budget are fresh enough in investor minds to raise some anxiety about gilt supply as the budget approaches and that may be triggering a bit of extra volatility in gilt prices.

Performance review

	3 months	6 months	Since launch 30 Nov 23
Rathbone Greenbank Global Sustainable Bond Fund	4.61%	4.91%	9.0%
Benchmark*	4.74%	5.07%	9.12%

* The fund's benchmark consists of 70% ICE BofA Global Corporate Index, 15% ICE BofA Global Government ex Japan Index, 15% ICE BofA All Maturity Global High Yield Index (all GBP hedged).

These figures refer to past performance, which isn't a reliable indicator of future returns.

We felt that investors had got over-optimistic about the likely scale and speed of rate cuts, driving up the prices of long-dated government bonds a bit too much over the last few months. As a result, we sold some of our UK **Green Gilt 1.5% 2053s** and **Inter-American Development Bank 3.2% 2042s** ahead of the BoE and Fed moves. (As a reminder, we don't invest in US Treasuries because the US government's heavy military spending means these bonds don't meet our screening criteria. Instead, we focus on US dollar-denominated debt issued by big supranational institutions like the IADB, which behave in a similar way to Treasuries.) When the prices of 2053s later dipped, we added to them again as a cost-effective way to manage our duration (interest rate risk) exposure.

Corporate bonds got caught up in the big equity market sell-off in August driven by fears of a looming US recession. But most of the panicked surge in credit spreads (the extra yields that corporate bonds offer over government debt to reflect their higher default risks) reversed very quickly. Over the quarter as a whole, the ICE Bank of America Global Corporate Bond Index, which measures credit spreads, narrowed from 102 basis points (bps), to 100bps. We're not expecting spreads to blow out again without a big rise in defaults or downgrades (and that seems unlikely if central banks manage to pull off a soft economic landing.)

In August, we were delighted to be among the first investors to buy an innovative new **Amazon Reforestation-Linked Outcome bond 1.745% 2033** bond issued by the International Bank for Reconstruction and Development (the IBRD – the lending arm of the World Bank). You can find out more [here](#).

We bought some **Virgin Money 8.25% perpetual AT1** bonds. Nationwide Building Society recently bought Virgin Money in a deal that could create the UK's second-largest savings and mortgage provider. AT1s typically offer higher yields than more senior debt because the latter would be repaid before the former if issuer got into trouble. Nationwide's considerable financial strength (it benefits from particularly ample capital buffers) means we're comfortable owning these less senior (more subordinated) AT1s. Not only that, but there's the potential for these bonds' spreads, which have been wider than those of Nationwide's version of AT1s, to tighten and get nearer to the latter's. We also bought some Irish food and drink ingredients and flavourings producer **Kerry Group 3.375% 2033** bonds. The firm is committed to creating healthier and more sustainable foodstuffs and drinks.

We sold a few bonds issued by firms that we felt might see demand for their products weakening at this stage in the economic cycle. These included some US recycled auto parts distributor **LKQ 6.25% 2033s**, US electric vehicle parts supplier **BorgWarner 1% 2031s** and Ireland-based electric vehicle tech supplier **Aptiv 3.1% 2051s**.

Beyond the Fed's bumper cut...

Global government bond yields have been very sensitive to forecasts of rate cuts – especially to the expected path of US rates. Contradictory and volatile economic data, along with circumspect guidance from policymakers, has led the market to second-guess the path of rates many times over the past 12 months. This is likely to continue.

Nevertheless, we believe the outlook for fixed income investments is positive. Government bonds should be supported by the gravitational pull of lower rates as long as inflation stays in check, while also benefiting from their role as valuable protection from any further equity market volatility.

And gradual policy easing is a plus for corporate bonds too – it shows that the BoE and the Fed currently feel that a nasty recession that might drive a big blow-out in credit spreads probably isn't right around the corner.
